If it needs to be reproduced for any other purpose it is the centre’s responsibility to obtain the necessary copyright clearance. SQA’s NQ Assessment team may be able to direct you to the secondary sources.

These marking instructions have been prepared by examination teams for use by SQA appointed markers when marking external course assessments. This publication must not be reproduced for commercial or trade purposes.
General marking principles for Mathematics

Always apply these general principles. Use them in conjunction with the detailed marking instructions, which identify the key features required in candidates’ responses.

For each question, the marking instructions are generally in two sections:

- **generic scheme** — this indicates why each mark is awarded
- **illustrative scheme** — this covers methods which are commonly seen throughout the marking

In general, you should use the illustrative scheme. Only use the generic scheme where a candidate has used a method not covered in the illustrative scheme.

(a) Always use positive marking. This means candidates accumulate marks for the demonstration of relevant skills, knowledge and understanding; marks are not deducted for errors or omissions.

(b) If you are uncertain how to assess a specific candidate response because it is not covered by the general marking principles or the detailed marking instructions, you must seek guidance from your team leader.

(c) One mark is available for each •. There are no half marks.

(d) If a candidate’s response contains an error, all working subsequent to this error must still be marked. Only award marks if the level of difficulty in their working is similar to the level of difficulty in the illustrative scheme.

(e) Only award full marks where the solution contains appropriate working. A correct answer with no working receives no mark, unless specifically mentioned in the marking instructions.

(f) Candidates may use any mathematically correct method to answer questions, except in cases where a particular method is specified or excluded.

(g) If an error is trivial, casual or insignificant, for example $6 \times 6 = 12$, candidates lose the opportunity to gain a mark, except for instances such as the second example in point (h) below.
(h) If a candidate makes a transcription error (question paper to script or within script), they lose the opportunity to gain the next process mark, for example

\[
\begin{align*}
    x^2 + 5x + 7 &= 9x + 4 \\
    x - 4x + 3 &= 0 \\
    x &= 1
\end{align*}
\]

This is a transcription error and so the mark is not awarded.

This is no longer a solution of a quadratic equation, so the mark is not awarded.

The following example is an exception to the above

\[
\begin{align*}
    x^2 + 5x + 7 &= 9x + 4 \\
    x - 4x + 3 &= 0 \\
    (x - 3)(x - 1) &= 0 \\
    x &= 1 \text{ or } 3
\end{align*}
\]

(i) Horizontal/vertical marking

If a question results in two pairs of solutions, apply the following technique, but only if indicated in the detailed marking instructions for the question.

Example:

\[
\begin{align*}
    &\bullet^5 \quad \bullet^6 \\
    &\bullet^5 \quad x = 2 \quad x = -4 \\
    &\bullet^6 \quad y = 5 \quad y = -7
\end{align*}
\]

Horizontal: \(\bullet^5 x = 2\) and \(x = -4\)  
Vertical: \(\bullet^5 x = 2\) and \(y = 5\)  
\(\bullet^6 y = 5\) and \(y = -7\)

You must choose whichever method benefits the candidate, not a combination of both.

(j) In final answers, candidates should simplify numerical values as far as possible unless specifically mentioned in the detailed marking instruction. For example

\[
\begin{align*}
    \frac{15}{12} \text{ must be simplified to } &\frac{5}{4} \text{ or } 1\frac{1}{4} \\
    \frac{43}{1} \text{ must be simplified to } &43 \\
    \frac{15}{0.3} \text{ must be simplified to } &50 \\
    \frac{4}{3} \text{ must be simplified to } &\frac{4}{15} \\
    \sqrt{64} \text{ must be simplified to } &8
\end{align*}
\]

*The square root of perfect squares up to and including 100 must be known.*
(k) Commonly Observed Responses (COR) are shown in the marking instructions to help mark common and/or non-routine solutions. CORs may also be used as a guide when marking similar non-routine candidate responses.

(i) Do not penalise candidates for any of the following, unless specifically mentioned in the detailed marking instructions:

- working subsequent to a correct answer
- correct working in the wrong part of a question
- legitimate variations in numerical answers/algebraic expressions, for example angles in degrees rounded to nearest degree
- omission of units
- bad form (bad form only becomes bad form if subsequent working is correct), for example

\[(x^3 + 2x^2 + 3x + 2)(2x + 1)\] written as

\[(x^3 + 2x^2 + 3x + 2) \times 2x + 1\]

\[= 2x^4 + 5x^3 + 8x^2 + 7x + 2\]

gains full credit

- repeated error within a question, but not between questions or papers

(m) In any ‘Show that...’ question, where candidates have to arrive at a required result, the last mark is not awarded as a follow-through from a previous error, unless specified in the detailed marking instructions.

(n) You must check all working carefully, even where a fundamental misunderstanding is apparent early in a candidate’s response. You may still be able to award marks later in the question so you must refer continually to the marking instructions. The appearance of the correct answer does not necessarily indicate that you can award all the available marks to a candidate.

(o) You should mark legible scored-out working that has not been replaced. However, if the scored-out working has been replaced, you must only mark the replacement working.

(p) If candidates make multiple attempts using the same strategy and do not identify their final answer, mark all attempts and award the lowest mark. If candidates try different valid strategies, apply the above rule to attempts within each strategy and then award the highest mark.

For example:

<table>
<thead>
<tr>
<th>Strategy 1 attempt 1 is worth 3 marks.</th>
<th>Strategy 2 attempt 1 is worth 1 mark.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Strategy 1 attempt 2 is worth 4 marks.</td>
<td>Strategy 2 attempt 2 is worth 5 marks.</td>
</tr>
<tr>
<td>From the attempts using strategy 1, the resultant mark would be 3.</td>
<td>From the attempts using strategy 2, the resultant mark would be 1.</td>
</tr>
</tbody>
</table>

In this case, award 3 marks.
Detailed marking instructions for each question

<table>
<thead>
<tr>
<th>Question</th>
<th>Generic scheme</th>
<th>Illustrative scheme</th>
<th>Max mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>(a)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>( \bullet^1 ) start differentiation (^1)</td>
<td>( \bullet^1 \frac{1}{\sqrt{1-3x^2}} \times \ldots )</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>( \bullet^2 ) apply chain rule and complete differentiation (^2,3)</td>
<td>( \bullet^2 \frac{3}{\sqrt{1-9x^2}} )</td>
<td></td>
</tr>
</tbody>
</table>

Notes:

1. For \( \bullet^1\) do not accept \( \frac{1}{\sqrt{1-3x^2}} \times \ldots \) unless subsequently corrected.

2. For \( \bullet^2\) accept eg \( \frac{3}{\sqrt{1-(3x)^2}} \) or \( \frac{1}{\sqrt{9-x^2}} \).

3. For candidates who interpret \( \sin^{-1}3x \) as \( (\sin 3x)^{-1} \), \( \bullet^2 \) is available for \( -(\sin 3x)^{-2} \times \cos 3x \).

Commonly Observed Responses:

<table>
<thead>
<tr>
<th>(b)</th>
<th></th>
<th>( \bullet^3 \frac{5(7x+1)e^{5x}}{(7x+1)^2} ) OR ( \frac{-7e^{5x}}{(7x+1)^2} )</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>( \bullet^3 ) evidence use of quotient rule with denominator and one term of numerator correct</td>
<td>( \bullet^4 \frac{5(7x+1)e^{5x}-7e^{5x}}{(7x+1)^2} )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( \bullet^4 ) complete differentiation</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Notes:

Commonly Observed Responses:

Alternative Method 1 (Product Rule)

\( \bullet^3 \) \( 5e^{5x}(7x+1)^{-1} \) ...

\( \bullet^4 \) \( -7e^{5x}(7x+1)^{-2} \)

Alternative Method 2 (Logarithmic differentiation)

\( \bullet^3 \) \( \ln y = 5x - \ln|7x+1| \) and \( \frac{1}{y} \frac{dy}{dx} = \ldots \)

\( \bullet^4 \) \( \frac{dy}{dx} = y \left( 5 - \frac{7}{7x+1} \right) \)
<table>
<thead>
<tr>
<th>Question</th>
<th>Generic scheme</th>
<th>Illustrative scheme</th>
<th>Max mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. (c)</td>
<td>•(^5) start to differentiate product with one term correct (^1)</td>
<td>•(^5) (\frac{dy}{dx}) (\cos x + \ldots) OR (-y\sin x + \ldots)</td>
<td>4</td>
</tr>
<tr>
<td></td>
<td>•(^6) complete differentiation of product (^1)</td>
<td>•(^6) (\frac{dy}{dx}) (\cos x\ldots) OR (-y\sin x)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>•(^7) differentiate remaining terms</td>
<td>•(^7) (2y\frac{dy}{dx} = 6)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>•(^8) express derivative explicitly in terms of (x) and (y) (^2)</td>
<td>•(^8) (\frac{dy}{dx} = 6 + y\sin x) (\cos x + 2y)</td>
<td></td>
</tr>
</tbody>
</table>

Notes:
1. •\(^5\) and •\(^6\) are not available where the differentiation of \(ycosx\) leads to only one term.
2. •\(^8\) is available only where \(\frac{dy}{dx}\) appears more than once after completing differentiation.

Commonly Observed Responses:
2. 

<table>
<thead>
<tr>
<th>Question</th>
<th>Generic scheme</th>
<th>Illustrative scheme</th>
<th>Max mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>•¹ state expression</td>
<td>•¹ ( \frac{3x-7}{x^2-2x-15} = \frac{A}{x+3} + \frac{B}{x-5} )</td>
<td>4</td>
</tr>
<tr>
<td>2.</td>
<td>•² form equation and find one unknown (^1)</td>
<td>•² (3x-7 = A(x-5) + B(x+3)) AND eg (A = 2)</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>•³ find second unknown and write integral expression (^{1,2})</td>
<td>•³ (B = 1) AND (\int \left( \frac{2}{x+3} + \frac{1}{x-5} \right) dx) stated or implied by •⁴</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>•⁴ integrate (^{3,4})</td>
<td>•⁴ (2\ln</td>
<td>x+3</td>
</tr>
</tbody>
</table>

Notes:
1. •² and •³ may be awarded where an attempt at factorisation leads to an incorrect linear denominator.
2. At •³ disregard the omission of \(dx\).
3. At •⁴ disregard the omission of modulus signs.
4. •⁴ is not available where the constant of integration has either been omitted or first appears after an incorrect logarithmic term.

Commonly Observed Responses:

\[
\frac{3x-7}{x^2-2x-15} = \frac{A}{x-3} + \frac{B}{x+5} \quad \text{do not award} \quad •¹
\]

\[
3x-7 = A(x+5) + B(x-3) \quad \text{award} \quad •²
\]

AND eg \(A = \frac{1}{4}\)

\[
B = \frac{11}{4}
\]

AND \(\int \left( \frac{1}{4(x-3)} + \frac{11}{4(x+5)} \right) dx\) stated or implied by •⁴

\[
\frac{1}{4}\ln|x-3| + \frac{11}{4}\ln|x+5| + c \quad \text{award} \quad •⁴
\]
<table>
<thead>
<tr>
<th>Question</th>
<th>Generic scheme</th>
<th>Illustrative scheme</th>
<th>Max mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>3. (a)</td>
<td></td>
<td></td>
<td>3</td>
</tr>
<tr>
<td></td>
<td>• 1 state general term $1,2$</td>
<td>$\binom{9}{r}(2x)^{9-r}\left(\frac{5}{x^2}\right)^r$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 2 simplify powers of $x$ OR coefficients $1,2$</td>
<td>$2^{9-r}5^r x^{9-3r}$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 3 state simplified general term (complete simplification) $1,2,3$</td>
<td>$\binom{9}{r}2^{9-r}5^r x^{9-3r}$</td>
<td></td>
</tr>
</tbody>
</table>

Notes:

1. Where candidates write out a full binomial expansion, • 1, • 2 and • 3 are not available unless the general term is identifiable in (b).
2. Candidates who write down $\sum_{r=0}^{9} \binom{9}{r}(2x)^{9-r}\left(\frac{5}{x^2}\right)^r$ with no working receive full marks.
3. • 3 is unavailable to candidates who in (a) produce further incorrect simplification subsequent to a correct answer eg $2^{9-r}5^r$ becomes $10^9$ or $x^{9-3r}$ becomes $x^{6r}$.

Commonly Observed Responses:

1. General term has not been isolated.  
   \[
   \sum_{r=0}^{9} \binom{9}{r}(2x)^{9-r}\left(\frac{5}{x^2}\right)^r
   \]
   = $\sum_{r=0}^{9} \binom{9}{r}2^{9-r}5^r x^{9-3r}$
   Do not award • 1. Award • 2 and • 3.

2. General term has been isolated.  
   \[
   \sum_{r=0}^{9} \binom{9}{r}(2x)^{9-r}\left(\frac{5}{x^2}\right)^r
   \]
   = $\sum_{r=0}^{9} \binom{9}{r}2^{9-r}5^r x^{9-3r}$
   Disregard the incorrect use of the final equals sign. Award • 1, • 2 and • 3.

3. Binomial expression has been equated to general term.  
   \[
   \left(2x + \frac{5}{x^2}\right)^9 = \binom{9}{r}(2x)^{9-r}\left(\frac{5}{x^2}\right)^r
   \]
   Disregard the incorrect use of the equals sign. Award • 1.
<table>
<thead>
<tr>
<th>Question</th>
<th>Generic scheme</th>
<th>Illustrative scheme</th>
<th>Max mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>(b)</td>
<td>4 determine value of $r$</td>
<td>4 $r = 3$</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>5 evaluate term $t_1,t_2$</td>
<td>5 672000</td>
<td></td>
</tr>
</tbody>
</table>

Notes:
1. Where candidates write out a full expansion $4$ may be awarded where this is complete and correct at least as far as the required term. $5$ may be awarded only where the required term is clearly identified from the expansion.
2. $5$ is not available to candidates who interpret the term independent of $x$ as substituting $x = 0$.

Commonly Observed Responses:

Binomial expansion as far as required term.

\[
\left(2x + \frac{5}{x^2}\right)^9 = 512x^9 + 11520x^6 + 115200x^3 + 672000...
\]

or

\[
\left(2x + \frac{5}{x^2}\right)^9 = \frac{1953125}{x^{18}} + \frac{703125}{x^{15}} + \frac{1125000}{x^{12}} + \frac{1050000}{x^9} + \frac{6098400}{x^6} + \frac{2520000}{x^3} + 672000...
\]
<table>
<thead>
<tr>
<th>Question</th>
<th>Generic scheme</th>
<th>Illustrative scheme</th>
<th>Max mark</th>
</tr>
</thead>
</table>
| 4. (a)   | •$^1$ state conjugate  
•$^2$ substitute for $z_1, \bar{z}_2$, expand and apply $i^2 = -1^{1/2}$ | •$^1$ $\bar{z}_2 = p + 6i$ stated or implied  
•$^2$ $(2p - 18) + (3p + 12)i$ | 2 |

**Notes:**
1. At $•^2$ accept $2p + 12i + 3pi - 18$.
2. To award $•^2 (2 + 3i)$ must be multiplied by another complex number.

**Commonly Observed Responses:**
Candidates find $z_1z_2$:
$2p + 3pi - 12i + 18$  
**do not award $•^1$**  
**award $•^2$**

| (b)       | •$^3$ find value of $p$ | $•^3$ $-4$ | 1 |

**Notes:**

**Commonly Observed Responses:**

| 5.        | •$^1$ start process  
•$^2$ obtain remainder of 17$^1$  
•$^3$ express gcd in terms of 306 and 119  
•$^4$ obtain $a$ and $b$ $^2,^3$ | •$^1$ $306 = 2 \times 119 + 68$  
$(119 = 1 \times 68 + 51)$  
$68 = 1 \times 51 + 17$  
$(51 = 3 \times 17)$  
$17 = -1 \times 119 + 2 (306 - 2 \times 119)$  
•$^3$ $a = 2, b = -5$ | 4 |

**Notes:**
1. At $•^2$ the gcd and the final line of working do not have to be stated explicitly.
2. The minimum requirement for $•^4$ is $306 \times 2 + 119 \times (-5) = 17$.
3. Do not accept $306 \times 2 - 119 \times 5 = 17$ where the values of $a$ and $b$ have not been explicitly stated.

**Commonly Observed Responses:**
6.  

<table>
<thead>
<tr>

<td>( y = -\frac{9}{2}x + 5 )</td>
<td></td>
</tr>
</tbody>
</table>

Notes:

1. Evidence for ² could include eg \( \frac{dy}{dx} = \frac{3}{2t} \).
2. Where candidates evaluate \( \frac{dx}{dt} \) and \( \frac{dy}{dx} \) before finding \( \frac{dy}{dt} \), award ² for evaluating the individual derivatives and award ¹ for evaluating \( \frac{dy}{dx} \).
3. At ⁵ accept eg \( y + \frac{9}{2}x - 5 = 0 \), \( 2y + 9x = 10 \). Do not accept \( y - 0 = \ldots \) or \( y = \frac{-9}{2}(x - \frac{10}{9}) \).

Commonly Observed Responses:

Incorrect expression for \( \frac{dy}{dt} \).

\[
\frac{dy}{dt} = \frac{1}{3t+2}
\]

leading to \( y = -\frac{3}{2}x + \frac{5}{3} \) may be awarded a maximum of 4/5.

<td>• 4 $\frac{2}{5} \left[ u^5 \right]_{\frac{1}{2}}^{1}$ and $\frac{31}{80}$ (or 0.3875)</td>
<td></td>
</tr>
</tbody>
</table>

Notes:

1. • 3 is available where candidates either omit limits or retain limits for $\theta$.
2. Where candidates attempt to integrate an expression containing both $u$ and $\theta$, where $\theta$ is either inside the integrand or erroneously taken outside as a constant, only • 1 and • 2 may be available.
3. Where candidates do not change limits but who produce working leading to $\frac{2}{5} \left[ \sin^3 \theta \right]_{\frac{1}{2}}^{\pi}$, • 2 may be awarded.
4. For candidates who arrive at $\frac{2}{5} \left[ \sin^3 \theta \right]_{\frac{1}{2}}^{\pi}$ by inspection full marks are still available.
5. For candidates who integrate incorrectly, • 4 may be available provided division by zero does not occur.
6. • 4 is not available to candidates who write limits using degrees.
7. At • 4 accept decimal answers rounded to at least 3 significant figures.

Commonly Observed Responses:

Integration by parts

\[
\int 2\sin^4 \theta \cos \theta \, d\theta = \left[ 2\sin^4 \theta \sin \theta \right]_{\frac{\pi}{6}}^{\pi} - \frac{8}{\pi} \sin^3 \theta \cos \theta \sin \theta \, d\theta
\]

\[
= \left[ 2\sin^5 \theta \right]_{\frac{\pi}{6}}^{\pi} - 4\int 2\sin^4 \theta \cos \theta \, d\theta
\]

\[
\frac{5}{4} \int 2\sin^4 \theta \cos \theta \, d\theta = \left[ 2\sin^5 \theta \right]_{\frac{\pi}{6}}^{\pi}
\]

\[
\int 2\sin^4 \theta \cos \theta \, d\theta = \frac{31}{80}
\]
<table>

<tr>
<td>9. (a)</td>
<td>• 1 form the sum of three consecutive integers (1,2,3,4,5)</td>
<td>• 1 ((n-1)+n+(n+1))</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>• 2 communication (1,5)</td>
<td>• 2 (3n) which is divisible by 3</td>
<td></td>
</tr>
</tbody>
</table>

**Notes:**

1. Candidates may form the sum \(n+(n+1)+(n+2)\) leading to \(3(n+1)\) at •2.
2. Withhold •1 where candidates construct an expression of the form \(an+(an+1)+(an+2)\), where 
   \(a \neq \pm 1\) and \(a \in \mathbb{Z}\). •2 may be available.
   eg \(4n+(4n+1)+(4n+2)\) leading to \(3(4n+1)\) which is divisible by 3.
3. Where candidates equate an expression for the sum of 3 consecutive integers to a multiple of 3 see commonly observed responses.
4. At •1 accept an expression such as \(n+n+1+n+2\).
5. Withhold •1 and •2 where candidates form one (or more) sum of 3 specific consecutive numbers eg \(2+3+4\).

**Commonly Observed Responses:**

A. \[x+(x+1)+(x+2)=3k\]
   \[3x+3=3k\]
   \[3(x+1)=3k\text{, where }k=x+1\text{ and }3k\text{ is divisible by }3.\]
   Award 2/2

B. \[x+(x+1)+(x+2)=3k\]
   \[3x+3=3k\]
   \[3(x+1)=3k\text{, where }k=x+1.\]
   The candidate has defined \(k\) but has not communicated divisibility. Award •1 but not •2.

C. \[(k+1)+(k+2)+(k+3)=3k+6\]
   \[\frac{3k+6}{3}=k+2\text{ therefore statement is true}\]
   The candidate has explicitly divided and there is no requirement to state that \(k+2\) is an integer. Award 2/2.

</table>

**Notes:**

1. Where candidates write down $2k + 1 = k + (k + 1)$ and omit $k \in \mathbb{Z}$, award •³.
2. Where candidates omit brackets and write down $k + k + 1$ do not award •³ unless the candidate demonstrates that $k$ and $k + 1$ are two consecutive integers eg writing $k, k + 1$.
3. Where candidates begin with consecutive integers, •³ may be awarded only where $2k + 1$ is associated with any odd integer and not by a restatement of the assertion in the question.

**Commonly Observed Responses:**

A. $k + (k + 1) = 2k + 1$ odd
   
   Do not award •³. The candidate has not defined a general odd integer.

B. $k + (k + 1) = 2k + 1$ and $2k + 1$ represents any odd integer.
   
   Award •³. The candidate has defined a general odd integer.

C. $2k + 1$
   
   $k + (k + 1) = 2k + 1$
   
   Award •³. The candidate has begun with the general form for an odd integer.

<td>1</td>
</tr>
</tbody>
</table>

Notes:

1. Accept \[ \begin{pmatrix} \frac{1}{2} & -\frac{\sqrt{3}}{2} \\ \frac{\sqrt{3}}{2} & \frac{1}{2} \end{pmatrix}. \]

Commonly Observed Responses:

(b) • 2 obtain B

Commonly Observed Responses:

(c) • 3 correct order for multiplication \((P = BA)\)

• 4 multiplication completed and appearance of exact values 1,2

Commonly Observed Responses:

2. • 4 is unavailable to candidates who have incorrectly identified \(B = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}\).

Incorrect order of multiplication

\[ \frac{1}{2} \begin{pmatrix} 1 & -\sqrt{3} \\ \sqrt{3} & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} = \frac{1}{2} \begin{pmatrix} 1 & \sqrt{3} \\ \sqrt{3} & -1 \end{pmatrix} \]

Do not award • 3. • 4 is still available on follow through.

</thead>
<tbody>
<tr>
<td>(d)</td>
<td>• 5 valid explanation 1,2,3,4</td>
<td>• 5 eg compare the elements of P with the general form of a rotation matrix</td>
<td>1</td>
</tr>
</tbody>
</table>

Notes:
1. • 5 may be awarded where a candidate’s explanation makes reference to the specific entries of the leading diagonal of P (“they should be equal but are not”) or trailing diagonal (“one must be negative of the other but is not”).
2. Withhold • 5 for a statement such as ‘Matrix P represents a reflection’ unless the reflection is specified eg ‘Matrix P is a reflection in the line \( y = -\frac{1}{\sqrt{3}}x \).’.
3. • 5 may also be awarded where candidates investigate the images of at least two points, neither of which is O.
4. Candidates who respond with reference to the constituent transformations of P may be awarded • 5 only where there is reference to both transformations and communication demonstrates understanding that an even number of reflections are required in order to produce a rotation.

Commonly Observed Responses:

Examples of responses where • 5 would be awarded

- “P is not associated with rotation about the origin as it is in the form \( \begin{pmatrix} \cos \theta & -\sin \theta \\ -\sin \theta & -\cos \theta \end{pmatrix} \).”
  (Explanation makes explicit reference to their form of P and implicitly refers to the form of a general rotation matrix.)
- “Because P can no longer be expressed as a certain angle of rotation. \( \cos^{-1} \left( \frac{1}{2} \right) \neq \cos^{-1} \left( -\frac{1}{2} \right) \).”
  cannot be expressed as an angle”.
  \[
  \begin{pmatrix}
  \cos^{-1} \left( \frac{1}{2} \right) & -\sin^{-1} \left( -\frac{\sqrt{3}}{2} \right) \\
  \sin^{-1} \left( -\frac{\sqrt{3}}{2} \right) & \cos^{-1} \left( -\frac{1}{2} \right)
  \end{pmatrix}
  =
  \begin{pmatrix}
  \frac{\pi}{3} & \frac{\pi}{3} \\
  -\frac{\pi}{3} & \frac{2\pi}{3}
  \end{pmatrix}
\]
  and as the angles found are not all equal, this transformation is not a rotation about the origin”.

Examples of responses where • 5 would not be awarded

“As matrix P doesn’t exhibit \( \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix} \).” (No reference made to form of P).
“Because it gets reflected in the process ...”.
“Since it is followed by a reflection”.
“\( \cos \) values different so do not relate to same angle”.
“Rotation is around a point on graph not the origin”.
“It would put the point back to where it started”.
“Rotations must have the matrix \( \begin{pmatrix} a & -b \\ b & a \end{pmatrix} \).”

<tr>
<td>Question</td>
<td>Generic Scheme</td>
<td>Illustrative Scheme</td>
<td>Max Mark</td>
</tr>
<tr>
<td>----------</td>
<td>----------------</td>
<td>---------------------</td>
<td>----------</td>
</tr>
</tbody>
</table>

**Notes:**

1. “RHS = 1, LHS = 1” and/or “True for n = 1” are insufficient for the award of $\bullet^1$. A candidate must demonstrate evidence of substitution into both expressions.

2. For $\bullet^2$ acceptable phrases for $n = k$ contain:
   - “If true for...”; “Suppose true for...”; “Assume true for...”.

   For $\bullet^2$ unacceptable phrases for $n = k$ contain:
   - “Consider $n = k$ ”, “assume $n = k$ ” and “True for $n = k$ ”.

   An acceptable phrase may appear at $\bullet^5$.

   For $\bullet^2$, in addition to an acceptable phrase containing $n = k$, accept:
   - “Aim/goal: $\sum_{r=1}^{k+1} 3^{r-1} = \frac{1}{2}(3^{k+1} - 1)$”.

   For $\bullet^2$ unacceptable phrases for $n = k + 1$ contain:
   - “Consider true for $n = k + 1$ ”, “true for $n = k + 1$ ”;
   - “$\sum_{r=1}^{k+1} 3^{r-1} = \frac{1}{2}(3^{k+1} - 1)$” (with no further working)

3. At $\bullet^3$ accept $... = \frac{1}{2}(3^k - 1) + 3^k$ or $... = \frac{1}{2}(3^k - 1) + 3^{k+1} - 1$.

4. At $\bullet^4$ accept $... = \frac{1}{2}(3 \times 3^k - 1)$.

5. $\bullet^5$ is unavailable to candidates who write down the correct expression without algebraic justification.

6. Full marks are available to candidates who state an aim/goal earlier in the proof and who subsequently achieve the stated aim/goal.

7. Following the required algebra and statement of the inductive hypothesis, the minimum acceptable response for $\bullet^5$ is “Then true for $n = k + 1$, but since true for $n = 1$, then true for all $n$” or equivalent.

**Commonly Observed Responses:**

<tr>
<td>13. (a)</td>
<td>•¹ Determine the relationship between ( x ) and ( h )</td>
<td>•¹ ( x^2 + h^2 = 2500 ) &lt;br&gt;( h = \sqrt{2500 - x^2} )</td>
<td>1</td>
</tr>
</tbody>
</table>

Notes:
1. Refer to general marking principle (m).

Commonly Observed Responses:

\[
\left( \frac{1}{2}h \right)^2 = 25^2 - \left( \frac{1}{2}x \right)^2 \quad \text{leading to correct answer} \quad \text{award •¹}
\]

\[
\frac{1}{2}h^2 = 25^2 - \frac{1}{2}x^2 \quad \text{leading to} \quad h^2 = 50^2 - x^2 \quad \text{do not award •¹}
\]

\[
\frac{1}{2}h^2 = 25^2 - \frac{1}{2}x^2 \quad \text{leading to} \quad h^2 = 4 \times 25^2 - x^2 \quad \text{or equivalent} \quad \text{award •¹}
\]

\[
\frac{1}{2}h = \sqrt{25^2 - \frac{1}{4}x^2} \quad \text{moving directly to correct answer} \quad \text{award •¹}
\]

(b)  

| ² interpret rate of change of \( x \) | ² \( \frac{dx}{dt} = -0.3 \) | 5 |
| ³ find \( \frac{dh}{dx} \) | ³ \( \frac{dh}{dx} = -2x \cdot \frac{1}{2} (2500 - x^2)^{\frac{1}{2}} \) |
| ⁴ form relationship ⁶ | ⁴ \( \frac{dh}{dt} = \frac{dx}{dt} \cdot \frac{dx}{dt} \) \( \text{stated or implied at •}^5 \) |
| ⁵ multiply by \( \frac{dx}{dt} \) ¹,²,⁶ | ⁵ \( \frac{dh}{dt} = \frac{0.3x}{\sqrt{2500 - x^2}} \) |
| ⁶ evaluate \( \frac{dh}{dt} \) ³,⁴,⁵,⁶ | ⁶ \( \frac{dh}{dt} = \frac{9}{40} \text{ cms}^{-1} \) |

Notes:
1. At •⁵ candidates may evaluate the derivatives separately eg \( \frac{dh}{dt} = -0.75 \times (-0.3) \).
2. At •⁵ simplification is not required.
3. At •⁶ units are required. Accept decimal equivalent (0.225 cms⁻¹).
4. Where candidates produce an incorrect answer, accept a decimal rounded to at least 2 significant figures.
5. Award •⁶ only where a candidate’s final answer for \( \frac{dh}{dt} \) is opposite in sign to that of \( \frac{dx}{dt} \).
6. For candidates who do not show evidence of related rates, •⁴, •⁵ and •⁶ are not available.

<tbody>
<tr>
<td>16. (d)</td>
<td>$10$ explanation $1,2,3$</td>
<td>$10$ Planes $\pi_2$ and $\pi_4$ are parallel because the normal of $\pi_4$ is a multiple of the normal of $\pi_2$.</td>
<td>1</td>
</tr>
</tbody>
</table>

Notes:
1. For the award of $10$ a statement must compare normal vectors or coefficients of $x$, $y$ and $z$.
   
   Accept eg $\begin{pmatrix} \ldots \\ \ldots \end{pmatrix} = -3 \begin{pmatrix} \ldots \\ \ldots \end{pmatrix}$ or ‘The normals are multiples of one another’ as justification for the planes being parallel.

2. Do not accept a plane equating to a vector eg $\pi_2 = \begin{pmatrix} -3 \\ 5 \\ 2 \end{pmatrix}$.

3. Withhold $10$ from candidates who provide a correct description but who subsequently write eg $\pi_4 = -3\pi_2$ or make reference to “direction vectors”.

Commonly Observed Responses:

The planes are parallel because:

1. their normals are multiples of each other. Award $10$
2. $\pi_4 = -3\pi_2$. Do not award $10$
3. their direction vectors are multiples of each other. Do not award $10$

<td>$g''(x) = 2 \sec^2 x(\sec^2 x) + (4 \sec^3 x \tan x) \tan x$</td>
<td></td>
</tr>
</tbody>
</table>

Notes:
1. Candidates can be awarded 4 only where the product or quotient rule is required to differentiate their expression for $g''(x)$.
2. At 4 there must be clear evidence of the product rule (or quotient rule).
3. 5 is not available to candidates who obtain an incorrect answer at 3.
4. 5 can be awarded only where the candidate completes the differentiation correctly and shows clearly that the result is equivalent to the expression asked for in the question.

Commonly Observed Responses:

| (ii) | 6 completes ALL evaluations | 6 | 2 |
|      | 7 substitute | 7 |  |
|      | $g(0) = 0$ | $g'(0) = 1$ | $g''(0) = 0$ |
|      | $g''(0) = 2$ | $g(x) = x + \frac{1}{3} x^3 ...$ |  |

Notes:
1. 7 is available only for powers of $x$ with numerical coefficients.

Commonly Observed Responses:
### Question 17. (c)

<table>
<thead>
<tr>
<th>Question</th>
<th>Generic scheme</th>
<th>Illustrative scheme</th>
<th>Max mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>17. (c)</td>
<td>• 8 multiply expressions 1</td>
<td>• 8 ((1 + 2x + 2x^2 + ...) \left( x + \frac{1}{3}x^3 \right))</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>• 9 multiply out and simplify 2</td>
<td>• 9 (x + 2x^2 + \frac{7}{3}x^3)</td>
<td></td>
</tr>
</tbody>
</table>

#### Notes:

1. For candidates who proceed via differentiation • 8 is available for obtaining all three derivatives correctly.

2. • 9 is available only for powers of \(x\) with numerical coefficients.

#### Commonly Observed Responses:
